Fawtir mobile: Reminders for invoices and bills, screens and APIs

Oct 3, 2026 · @Rixon Agency

0. What this covers and how the calls work

Fawtir has two different kinds of reminder. Keep them apart in the app:

	Income reminders	Expenditure (bill) reminders
Who gets them	Your **customer**, by e-mail	Your **own team**, never a supplier
What they chase	Unpaid invoices and debit notes	Bills due or late, discounts running out, approvals and mismatches left waiting, unconfirmed scans
Web screens	`/income/reminders`, `/income/reminders/settings`, the card on an invoice	`/expenditure/reminders`, the bell, the Bills count
API root	`/v1/payment-reminders/...` and `/v1/authored-invoices/{id}/reminders...`	`/v1/bill-reminders/...`

For mobile, build: the income settings (on/off and the days), the reminder card on one invoice (preview, send one now, history), the bill reminder rules and delivery settings, and the bell list with its unread count. Leave out the web-only queue table (there is no queue endpoint; the web builds it from four reads, see section 1).

Same rules as the Bills and Suppliers guide:

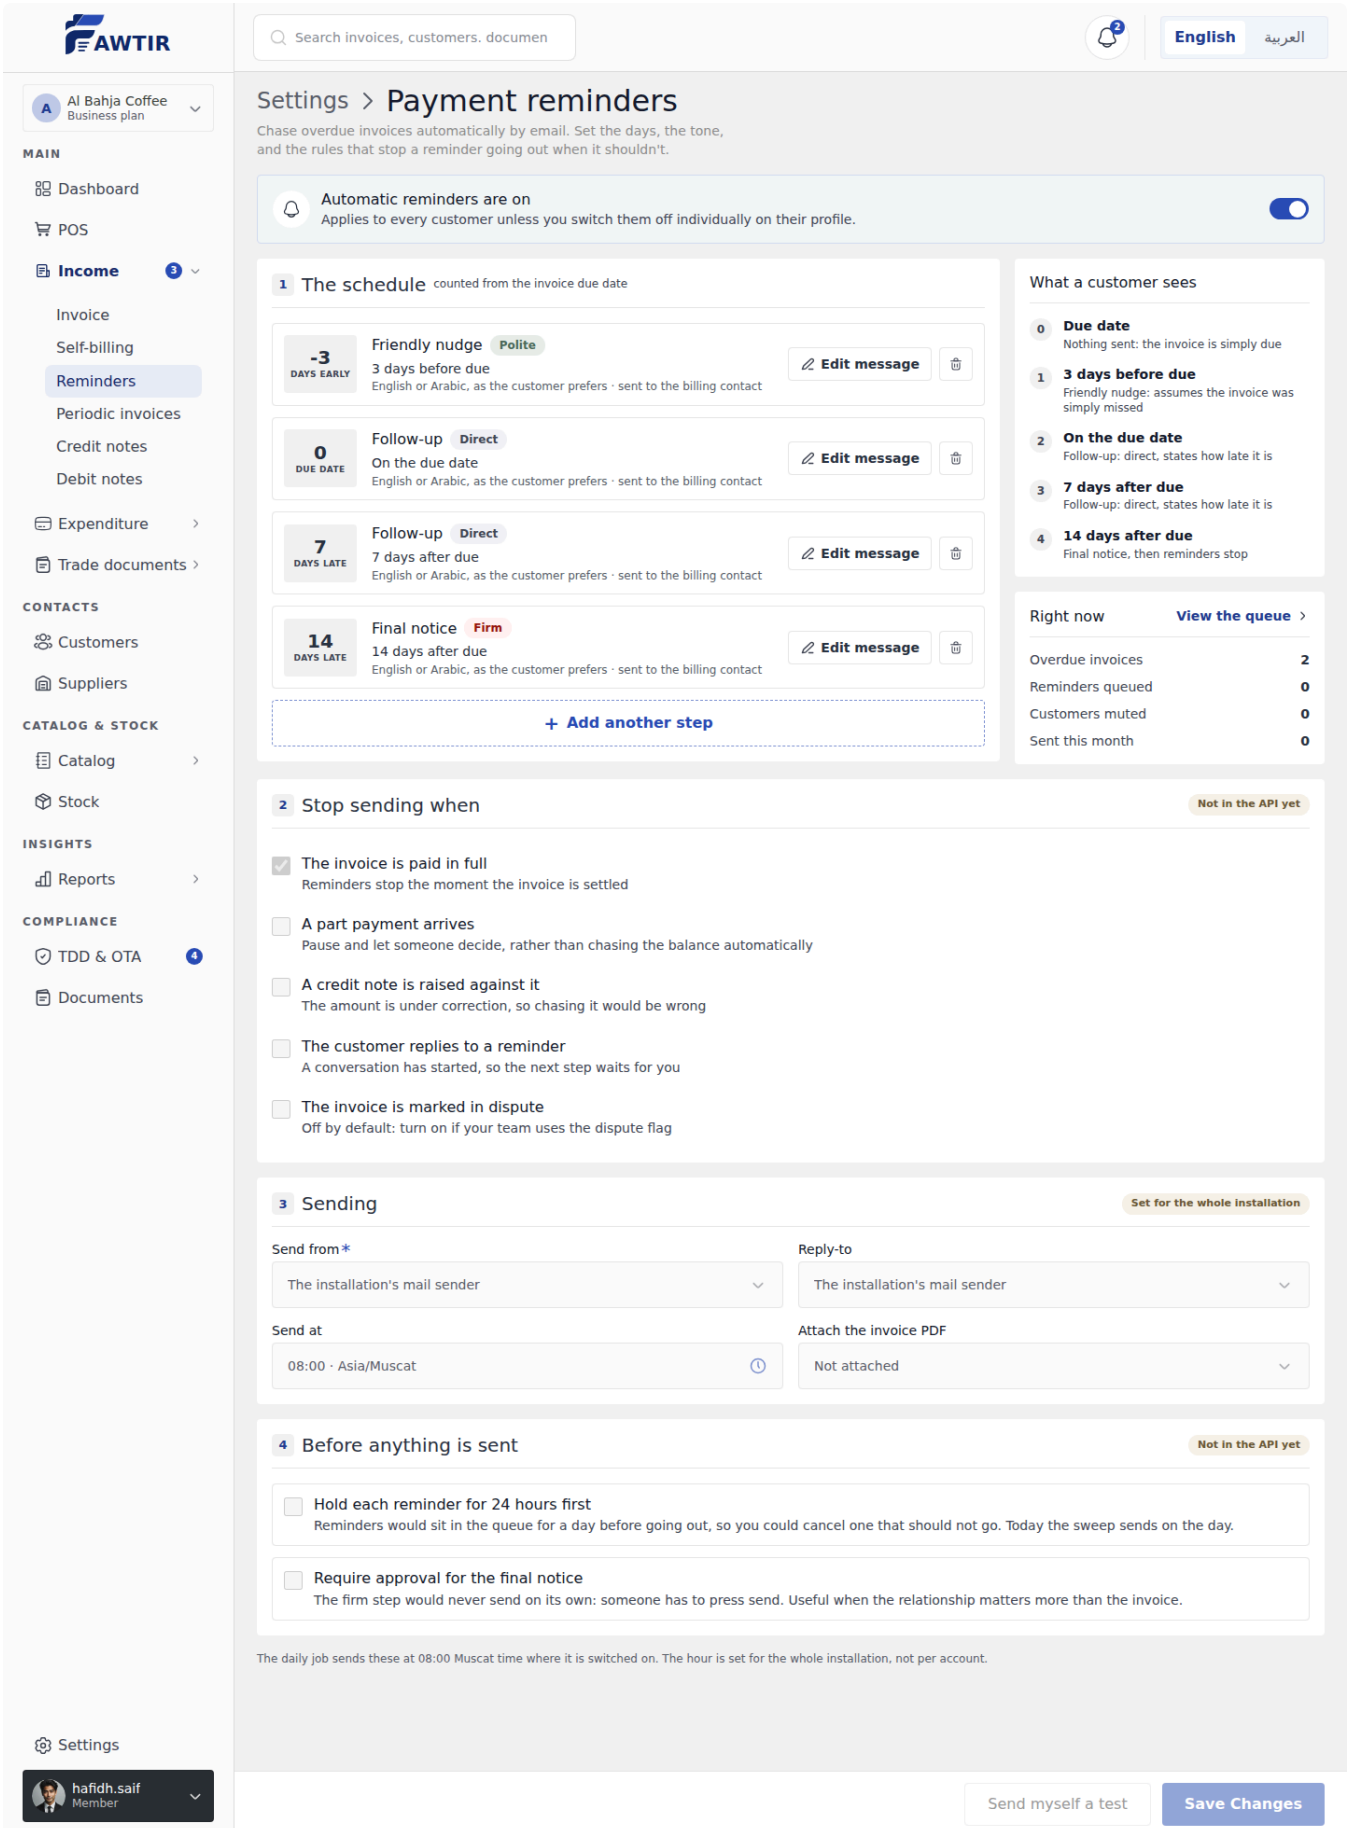

- Every call carries the session token and the company (tenant) header exactly as the other mobile calls do.
- A refusal comes back as a problem body: the code is in `error`, with `detail` and `trace_id`. Show our wording for the code (given below), not the server's `detail`.
- Days are whole numbers. Dates are `YYYY-MM-DD`. "Today" is always counted in **Asia/Muscat** time.

- Money shows with the rial sign and three decimals, as everywhere else.
- Hide what the user's permissions do not allow. They come from `GET /v1/me/entitlements`:

Action	Permission
Read or change the income schedule	`admin.settings.manage`
Read income reminder history and preview	`invoice.read`
Send an income reminder by hand	`invoice.payment.manage`
Read bill reminder rules, the bell	`invoice.read`
Save bill reminder rules and settings, list recipients	`invoice.payment.manage`

1. Income: the reminder schedule (settings)

The company sets one ladder of days, counted from each invoice's due date. Every day on the ladder is a "rung". At **08:00 Muscat time** the server sends one e-mail per rung to each customer with an unpaid invoice.

What a customer sees
0 Due date
Nothing sent: the invoice is simply due
1 3 days before due
Friendly nudge: assumes the invoice was simply missed
2 On the due date
Follow-up: direct, states how late it is
3 7 days after due
Follow-up: direct, states how late it is
4 14 days after due
Final notice, then reminders stop
Right now
View the queue
Overdue invoices 2
Reminders queued 0
Customers muted 0
Sent this month 0
2 Stop sending when
Not in the API yet
The invoice is paid in full
Reminders stop the moment the invoice is settled
A part payment arrives
Pause and let someone decide, rather than chasing the balance automatically
A credit note is raised against it
The amount is under correction, so chasing it would be wrong
The customer replies to a reminder
A conversation has started, so the next step waits for you
The invoice is marked in dispute
Off by default: turn on if your team uses the dispute flag
3 Sending
Set for the whole installation
Send from *
The installation's mail sender
Reply-to
The installation's mail sender
Send at
08:00 · Asia/Muscat
Attach the invoice PDF
Not attached
4 Before anything is sent
Not in the API yet
Hold each reminder for 24 hours first
Reminders would sit in the queue for a day before going out, so you could cancel one that should not go. Today the sweep sends on the day.
Require approval for the final notice
The firm step would never send on its own: someone has to press send. Useful when the relationship matters more than the invoice.
The daily job sends these at 08:00 Muscat time where it is switched on. The hour is set for the whole installation, not per account.
Send myself a test
Save Changes

Web: `/income/reminders/settings`. Only the on/off switch and the list of days are real API fields. The "Stop sending when" and "Before anything is sent" blocks are marked "Not in the API yet", and Sending (from, reply-to, 08:00, PDF) is set for the whole installation and is read-only. ***Do not build those on mobile.***

Read the schedule

`GET /v1/payment-reminders/schedule` (needs `admin.settings.manage`)

```
{ "enabled": true, "offsets": [-3, 0, 7, 14] }
```

- `offsets` are signed days from the due date: **negative = before**, **0 = the due date**, **positive = after**.
- Show each rung as "3 days before due", "On the due date" or "7 days after due".
- The web names the steps by position: the first is a Friendly nudge (polite), the middle ones are Follow-up (direct), the last is the Final notice (firm). That is only a label; there is no tone field.

Save the schedule

`PUT /v1/payment-reminders/schedule`

```
{ "enabled": true, "offsets": [-3, 0, 7, 14] }
```

- The server removes repeats and sorts the days. **Show the list the server sends back**, not what you sent. If the order changed, tell the user it was saved and sorted.
- Suggested starting ladder: `[-3, 0, 7, 14]`.
- Check on the phone before saving:

Rule	Our wording
Whole numbers only	"Give a whole number of days."
Each day within 365 of the due date	"Keep within 365 days of the due date."
No repeated day	"This rung is already in the list."
At most 10 rungs	"Up to 10 rungs."
Switched on with no rungs (server returns HTTP 400)	"Add a rung, or switch automatic reminders off."

- Switching `enabled` off is the "Pause everything" button: nothing is cancelled, the sweep just stops sending.

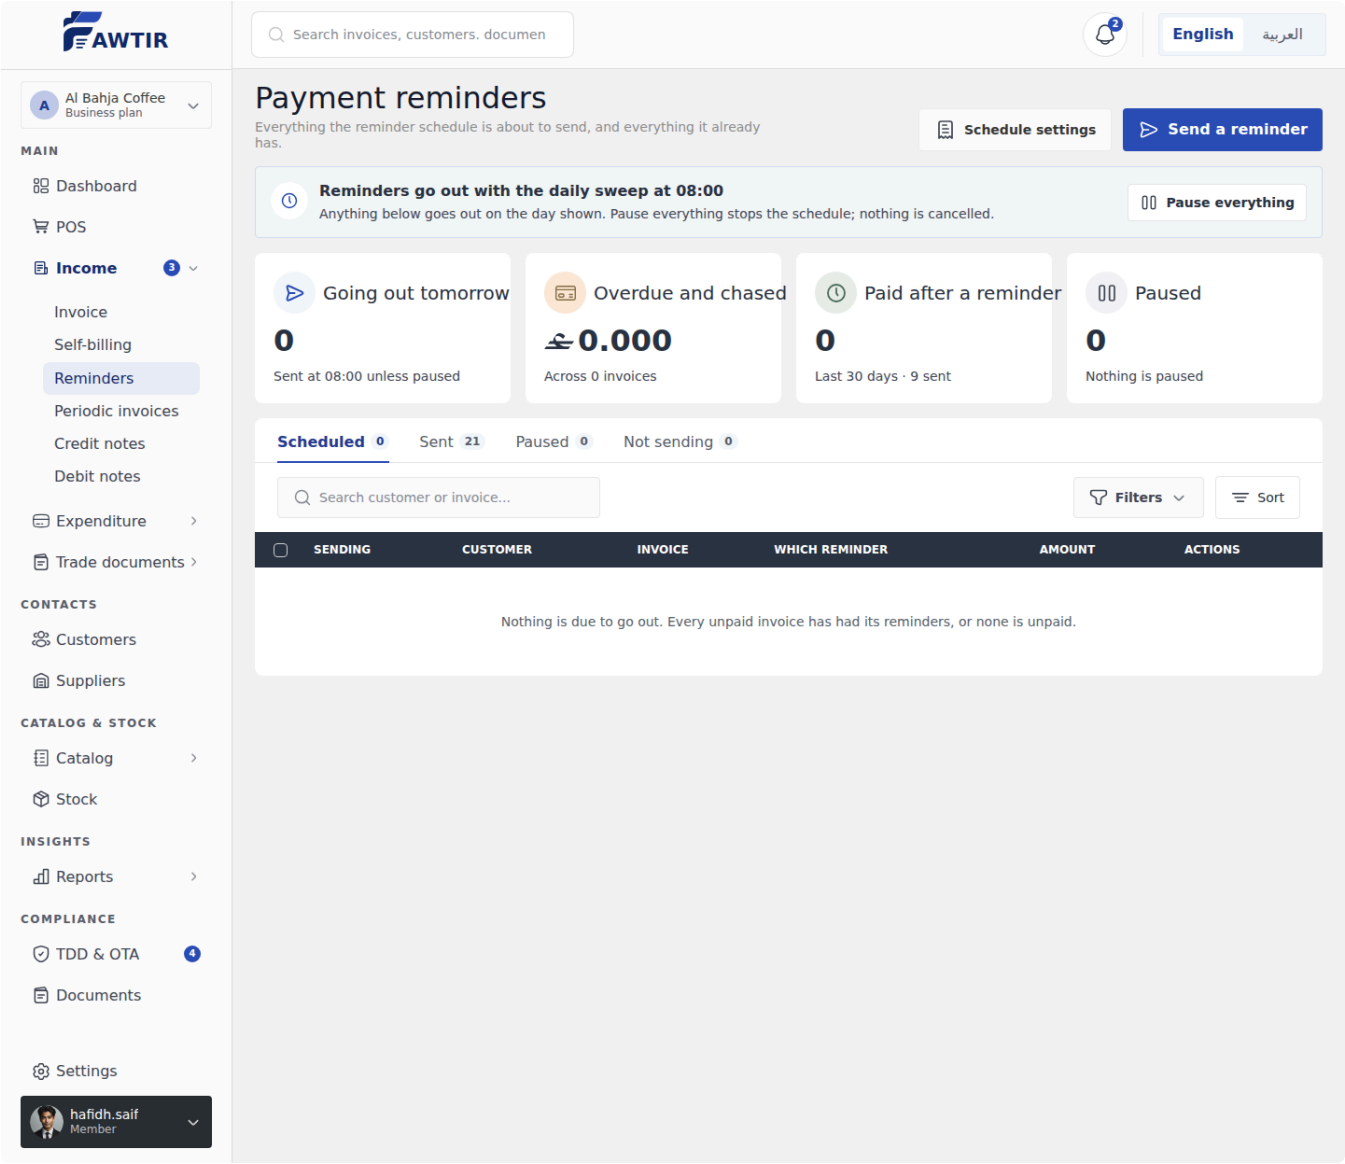

What else the user should know

- Delivery is **e-mail only**, in the customer's own language (English or Arabic, from the customer profile). There is no company language setting.
- A customer can be switched off from reminders on their profile: `deliveryPreferences.automaticPaymentReminders: false` on the customer, saved with the normal customer update.
- The sweep chases debit notes as well as invoices.

History for the whole company (optional on mobile)

`GET /v1/payment-reminders/log?invoice_id=&from=&to=&outcome=&page=&page_size=100` (needs `invoice.read`)

- `outcome` is `SENT`, `FAILED` or `SKIPPED`. `from` must not be after `to` ("The first date must come before the second.").
- The answer is a **bare array** with no total. If you get a full page, ask for the next page.
- Row: `invoiceId, invoiceNumber, daysFromDue, firedOn, recipient, locale, outcome, failureReason (or null), createdAt`. There is no customer name or amount in the row; join on `invoiceId` if you need them.

Web only: `/income/reminders`. There is no queue endpoint. The web builds this table itself from the schedule, the issued invoices, the customers and the log. We suggest mobile skips the queue and shows reminders on each invoice instead (section 2).

2. Income: reminders on one invoice

This is the main mobile screen for income reminders. On an issued, unpaid invoice show a small card: which reminder is next, a **Send now** button when allowed, and the list of reminders already sent.

*Web: `/invoices/{id}`. The blue bar at the top ("Reminder 4 of 4, no further reminders on the ladder", Send now) is the reminder card. "Reminder N of M" is the position of today's rung in the company ladder from section 1. The **Pause** button for one invoice has no API yet: do not build it.*

Preview: what would go out today

`GET /v1/authored-invoices/{id}/reminders/preview?days_from_due=N` (needs `invoice.read`)

- **Always send `days_from_due`**: today's date minus the due date, in days, counted in Muscat time, kept between -365 and 365. Without it, the server gives no message on any day that is not a rung.

```
{
  "invoiceId": "…", "invoiceNumber": "INV-2026-0043",
  "verdict": "SEND", "rung": 14,
  "recipient": "accounts@salalahbeach.om", "language": "en",
  "subject": "…", "body": "…"
}
```

`subject` and `body` are the real e-mail the server would send. Show them in a "Preview message" sheet. `rung`, `recipient`, `language`, `subject` and `body` can be null.

verdict	Show	Send now button?
`SEND`	This would go out now.	Yes
`NO_RUNG_TODAY`	No rung falls today.	Yes
`TENANT_DISABLED`	Automatic reminders are switched off, so nothing goes out on its own.	Yes
`CUSTOMER_OPTED_OUT`	This customer is set not to receive reminders.	No
`NOT_ISSUED`	The invoice has not been issued.	No
`SETTLED`	The invoice is settled, so there is nothing to chase.	No
`ALREADY_SENT`	This rung has already been used.	No
`NO_RECIPIENT`	The customer has no e-mail address on file.	No

Send one now

`POST /v1/authored-invoices/{id}/reminders/send` (needs `invoice.payment.manage`)

```
{ "daysFromDue": 14 }
```

Send `{}` to let the server pick today's rung. The answer has the same shape as the preview. On success show "Sent to {recipient}."

- **One send by hand per invoice per business day.**
- **A rung is used up once, for good.** The server keeps one reminder per invoice per day number, with no retry and no undo. Ask the user to confirm before sending.
- After any answer, success or refusal, read the preview and the history again.

`error`	Our wording
`REMINDER_NOT_SENDABLE`	This reminder cannot be sent for this invoice.

`error`	Our wording
`REMINDER_ALREADY_SENT`	That rung has already been used for this invoice. (If the `detail` mentions a business day: "A reminder was already sent by hand for this invoice today. Only one goes out by hand per day.")
`REMINDER_DELIVERY_UNAVAILABLE` (HTTP 503)	E-mail sending is not switched on for this installation, so nothing was sent.
`REMINDER_SEND_FAILED`	The e-mail was refused, and the rung has been used up. It cannot be tried again.

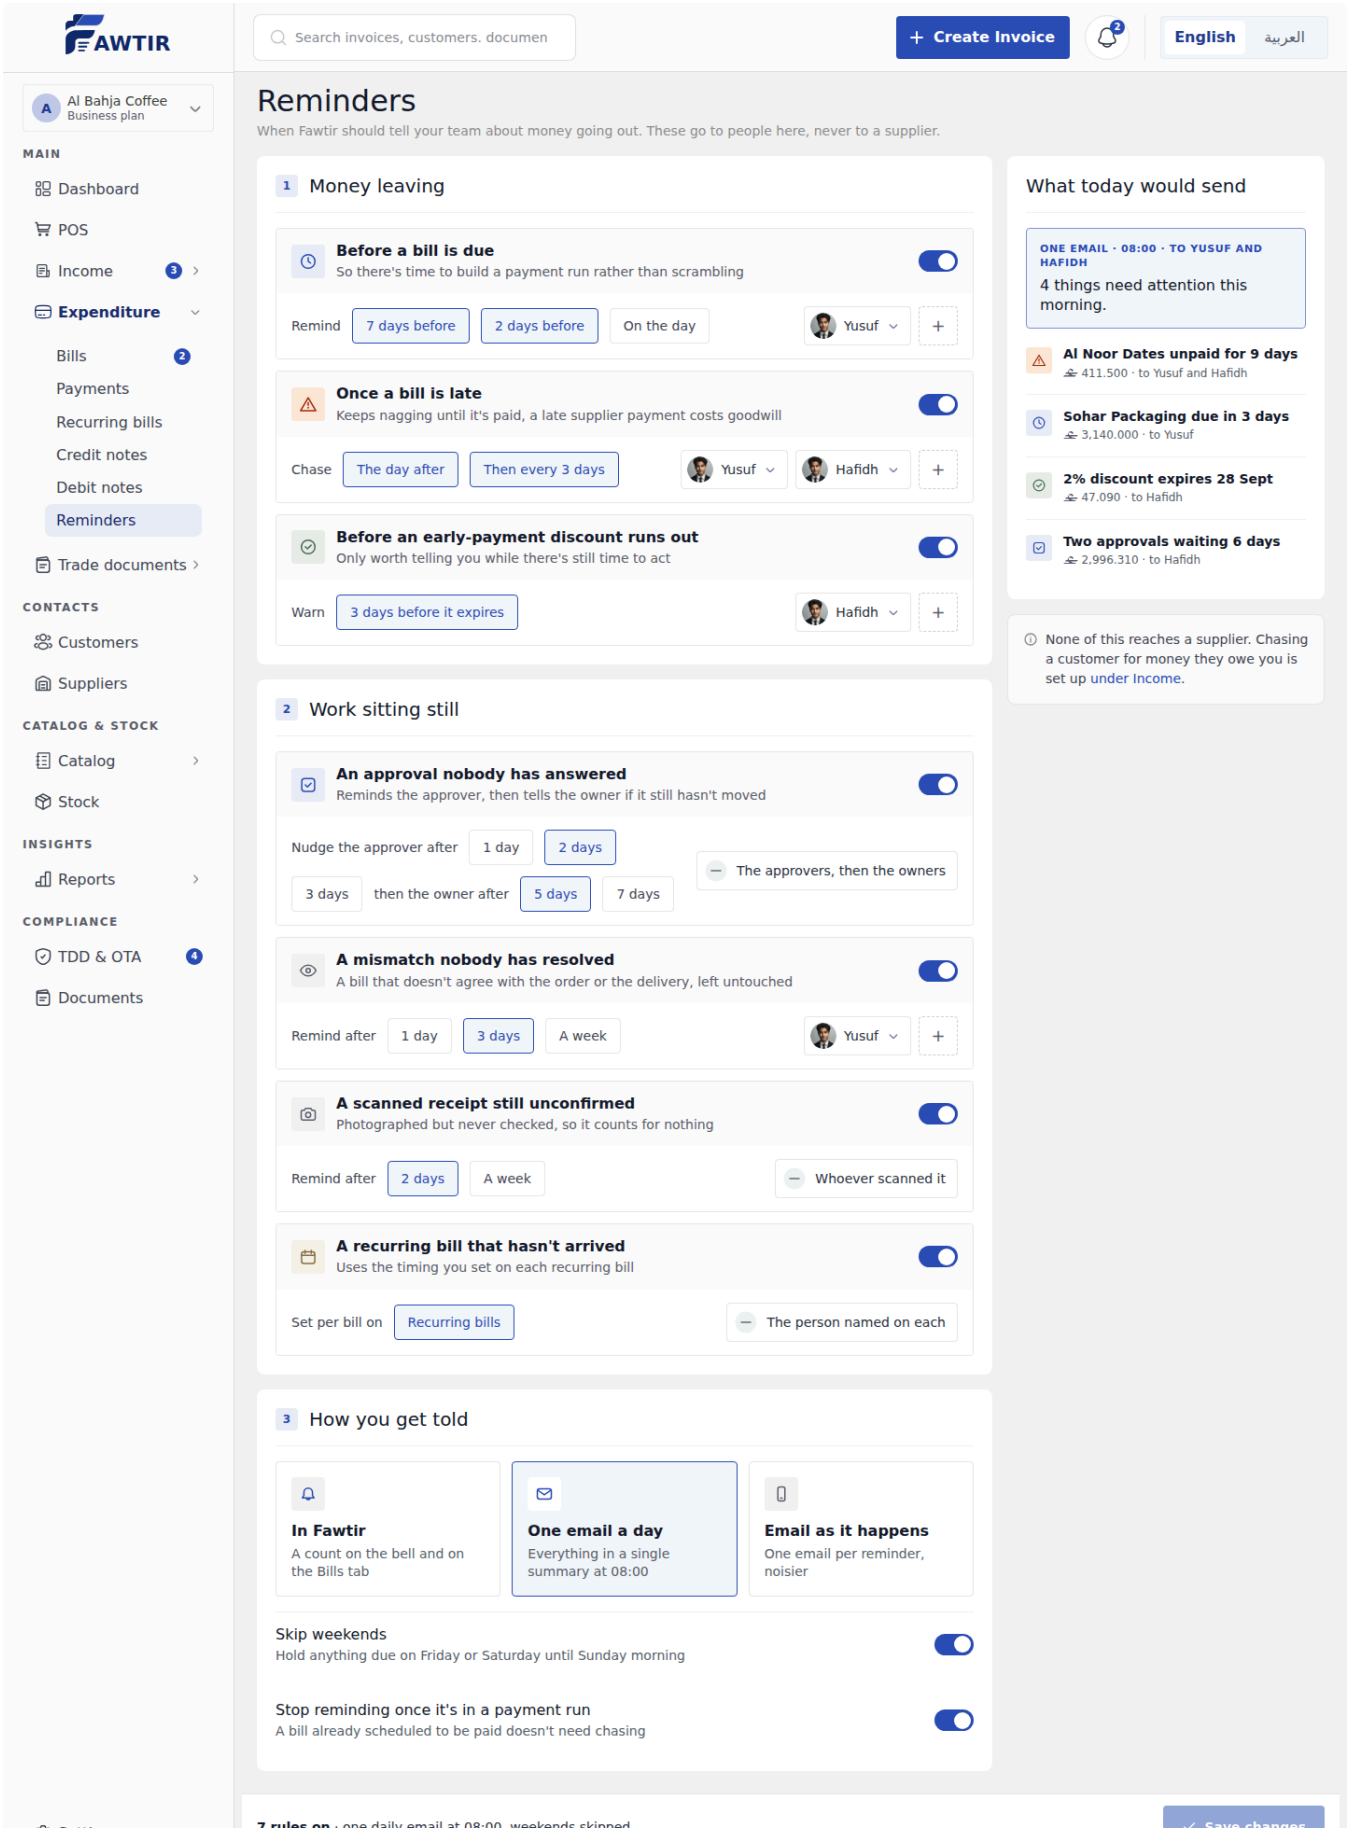

History on this invoice

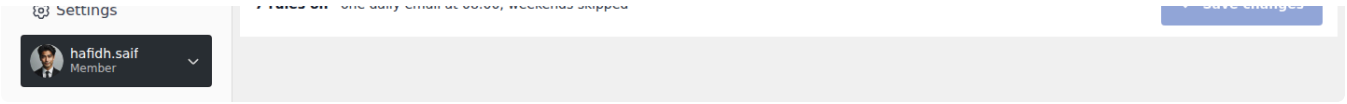

`GET /v1/authored-invoices/{id}/reminders` (needs `invoice.read`)

- A plain array, no paging, at most 100 rows. Same row as the log in section 1: `daysFromDue, firedOn, recipient, locale, outcome, failureReason`.
- Show each row as "7 days after due · 12 Sept 2026 · sent to accounts@…", with Failed or Skipped in red or grey. A Skipped row has no reason.

3. Expenditure: bill reminder rules and delivery

These tell **people on the team** about money going out. Nothing here ever reaches a supplier.

Reminders
When Fawtir should tell your team about money going out. These go to people here, never to a supplier.
1 Money leaving
Before a bill is due
So there's time to build a payment run rather than scrambling
Remind
7 days before
2 days before
On the day
Yusuf
Once a bill is late
Keeps nagging until it's paid, a late supplier payment costs goodwill
Chase
The day after
Then every 3 days
Yusuf
Hafidh
Before an early-payment discount runs out
Only worth telling you while there's still time to act
Warn
3 days before it expires
Hafidh
2 Work sitting still
An approval nobody has answered
Reminds the approver, then tells the owner if it still hasn't moved
Nudge the approver after
1 day
2 days
3 days
then the owner after
5 days
7 days
The approvers, then the owners
A mismatch nobody has resolved
A bill that doesn't agree with the order or the delivery, left untouched
Remind after
1 day
3 days
A week
Yusuf
A scanned receipt still unconfirmed
Photographed but never checked, so it counts for nothing
Remind after
2 days
A week
Whoever scanned it
A recurring bill that hasn't arrived
Uses the timing you set on each recurring bill
Set per bill on
Recurring bills
The person named on each
3 How you get told
In Fawtir
A count on the bell and on the Bills tab
One email a day
Everything in a single summary at 08:00
Email as it happens
One email per reminder, noisier
Skip weekends
Hold anything due on Friday or Saturday until Sunday morning
Stop reminding once it's in a payment run
A bill already scheduled to be paid doesn't need chasing
What today would send
ONE EMAIL · 08:00 · TO YUSUF AND HAFIDH
4 things need attention this morning.
Al Noor Dates unpaid for 9 days
411.500 · to Yusuf and Hafidh
Sohar Packaging due in 3 days
3,140.000 · to Yusuf
2% discount expires 28 Sept
47.090 · to Hafidh
Two approvals waiting 6 days
2,996.310 · to Hafidh
None of this reaches a supplier. Chasing a customer for money they owe you is set up under Income.

Web: `/expenditure/reminders`. Left: one card per rule (switch, days, who to tell). Bottom: how you get told. Right: what today's sweep would send. On mobile, a list of rules where each opens a sheet works well.

Read the rules

`GET /v1/bill-reminders/rules` (needs `invoice.read`)

```
{ "rules": [
  { "type": "BEFORE_DUE", "offsets": [7, 2], "repeatEveryDays": null,
    "escalationOffsets": null, "recipients": ["<user id>"], "enabled": true }
] }
```

type	Title	Days mean	Chips on web	Extra field	Who is told
`BEFORE_DUE`	Before a bill is due	days before due	7, 2, 0 (pick several)	none	chosen people, at least one
`LATE`	Once a bill is late	days after due	"The day after" (1)	`repeatEveryDays` (1 to 365), e.g. 3	chosen people, at least one
`DISCOUNT_EXPIRY`	Before an early-payment discount runs out	days before it expires	3	none	chosen people, at least one
`APPROVAL_STALE`	An approval nobody has answered	days waiting	1, 2, 3 (pick one)	`escalationOffsets`: owner after 5 or 7	fixed: "The approvers, then the owners" (send `[]`)
`MISMATCH_STALE`	A mismatch nobody has resolved	days left open	1, 3, 7 (pick one)	none	chosen people, at least one
`SCAN_UNCONFIRMED`	A scanned receipt still unconfirmed	days since scan	2, 7 (pick one)	none	fixed: "Whoever scanned it" (send `[]`)

"A recurring bill that hasn't arrived" is **not** a rule here. It is set on each recurring bill, and the server refuses it on this call. Show it as a read-only row that says it is set per bill.

Save the rules

`PUT /v1/bill-reminders/rules` (needs `invoice.payment.manage`)

- Body `{ "rules": [ … ] }` with exactly these six fields per rule: `type, offsets, repeatEveryDays, escalationOffsets, recipients, enabled`. **Any other field is refused.**
- It updates by `type`. A rule you leave out is kept as it is. A rule you send is replaced whole, so always send its full `recipients`.
- Limits: up to 10 days per rule, each 0 to 365, no repeats; up to 10 recipients. The server sorts the days.
- A switched-on rule needs some timing (days, repeat or escalation).

People to pick from: `GET /v1/recurring-bills/recipients` (needs `invoice.payment.manage`) returns `[{ "id": "…", "displayName": "Yusuf" }]`. `displayName` can be null.

`error`	Our wording
`REMINDER_RULE_NEEDS_RECIPIENT`, `REMINDER_RULE_RECIPIENT_REQUIRED`	This reminder has to name at least one person to tell.
`REMINDER_RULE_RECIPIENT_UNKNOWN`	One of the people chosen is no longer on the team. Choose again.
`REMINDER_RULE_TOO_MANY_RECIPIENTS`	That is more people than one reminder can tell.
`REMINDER_RULE_EMPTY`	Choose when to remind, or switch this off.
`REMINDER_RULE_OFFSET_OUT_OF_RANGE`, `REMINDER_RULE_ESCALATION_OUT_OF_RANGE`	That number of days isn't allowed here.
`REMINDER_RULE_REPEAT_OUT_OF_RANGE`	That repeat interval is outside the range the server accepts.
`REMINDER_RULE_REPEAT_NOT_ALLOWED`	That reminder does not repeat.
`REMINDER_RULE_ESCALATION_NOT_ALLOWED`	That reminder does not escalate, so it cannot have an escalation step.
`REMINDER_RULE_DUPLICATE`	That reminder is listed twice. Each kind can only be set once.

`error`	Our wording
`REMINDER_RULE_NOT_CONFIGURABLE`	That reminder is not set here. It is set on the recurring bill itself.

How you get told

`GET` and `PUT /v1/bill-reminders/settings` (PUT needs `invoice.payment.manage`)

```
{ "delivery": "DAILY_DIGEST", "digestTime": "08:00",
  "skipWeekends": true, "stopWhenInRun": true }
```

delivery	Title	Line under it
`IN_APP`	In Fawtir	A count on the bell and on the Bills tab
`DAILY_DIGEST`	One email a day	Everything in a single summary at {digestTime}
`IMMEDIATE_EMAIL`	Email as it happens	One email per reminder, noisier

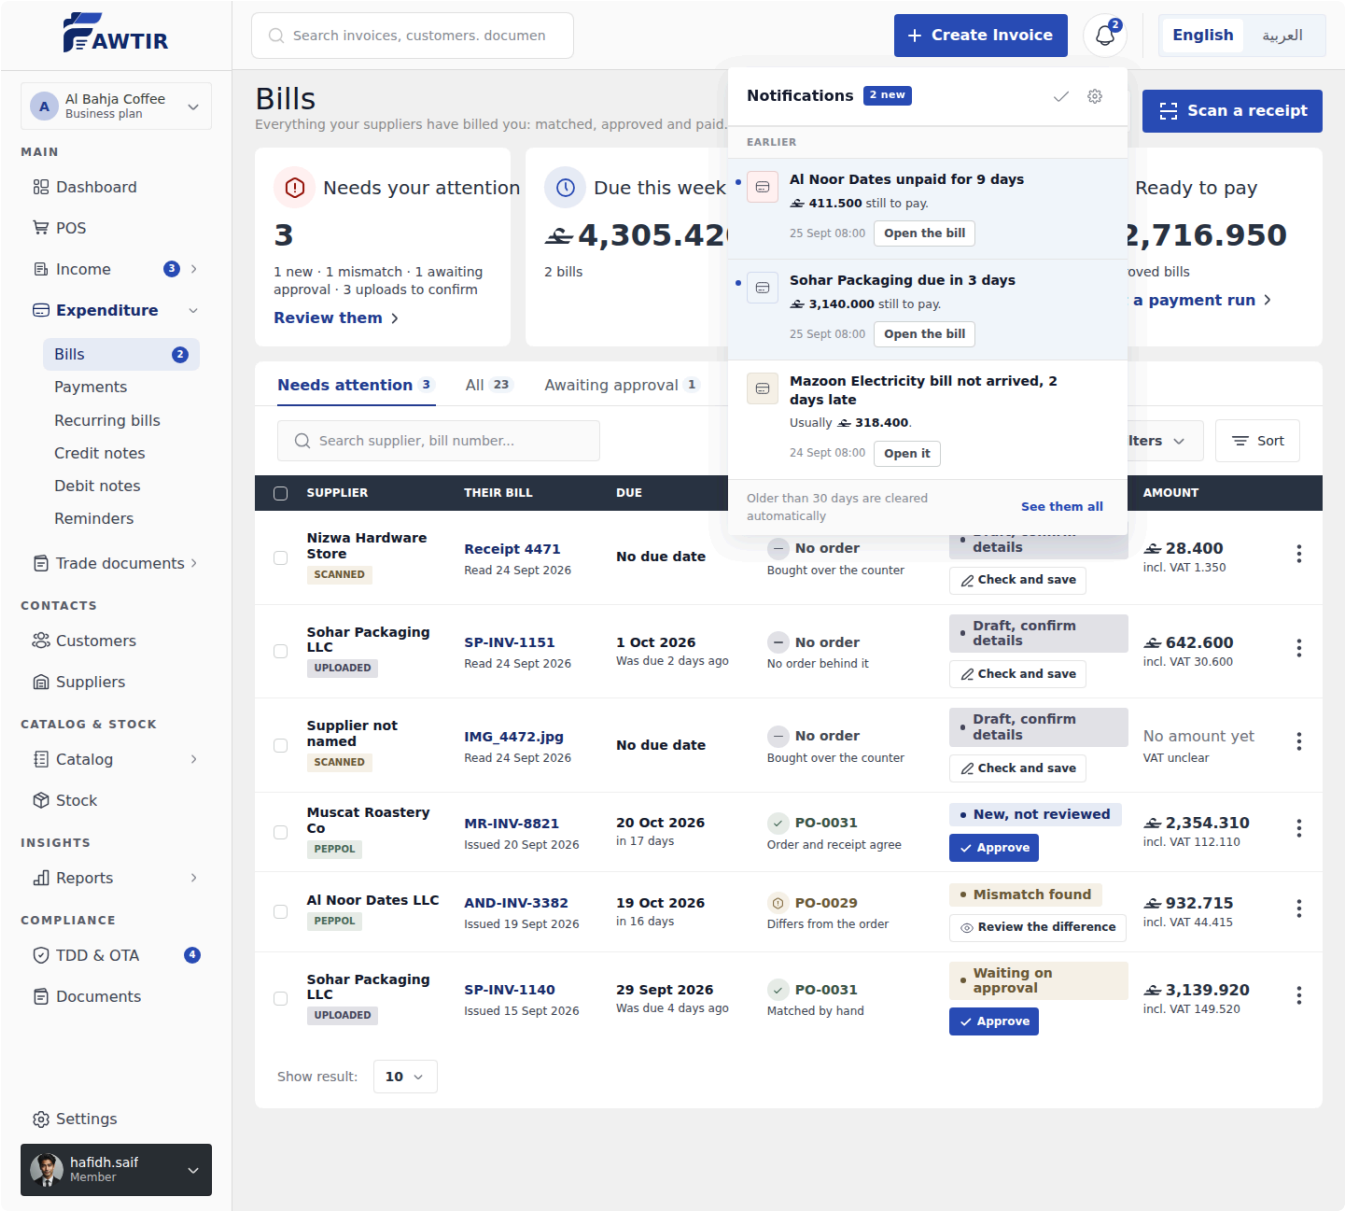

- `digestTime` is **always required** as `HH:mm`, even when not a digest (otherwise 400 "digestTime must be HH:mm"). Only the hour counts.
- `skipWeekends`: "Hold anything due on Friday or Saturday until Sunday morning".
- `stopWhenInRun`: "Stop reminding once it's in a payment run".
- The GET can also carry a read-only `sendingEnabled`. When it is `false`, show "Reminders are not being sent yet."
- Rules and settings are two calls. If the rules save and the settings fail, say: "The rules were saved, but the settings couldn't be saved. Try again."

What today would send (optional)

`GET /v1/bill-reminders/preview` returns `{ date, total, groups: [{ recipientUserId, displayName, headline, items: [{ ruleType, subjectType, subjectId, subjectDisplay, daysFromDue, headline, amount, currency }] }] }`. `subjectType` is `BILL`, `PURCHASE_ORDER`, `INTAKE` or `RECURRING_BILL`.

4. Expenditure: the bell and the Bills count

The bill reminders a person receives land in their own inbox. The web shows them under the bell, and the same unread number on the Bills menu item.

Web: the bell in the top bar. Each line names the supplier and how late or close the bill is, with the amount on the second line. The badge shows "9+" above 9.

Calls (all need `invoice.read`)

Call	Use
`GET /v1/bill-reminders/inbox/unread-count`	`{ "unread": 3 }`. The badge on the bell and on Bills. No page limit applies.
`GET /v1/bill-reminders/inbox?unread=true&limit=20`	The list. Leave out `unread` to get read ones too. `limit` defaults to 20.
`POST /v1/bill-reminders/inbox/{id}/acknowledge`	Mark one read. Only your own items; anyone else's is 404.
`POST /v1/bill-reminders/inbox/acknowledge-all`	Mark all read. Returns `{ "acknowledged": 5 }`.

- Read the count when the app opens or comes to the front, and read the list and count again when the user opens the panel. There is no push notification API and no set polling interval yet.
- Mark read on the phone at once; if the server refuses, read the list again.
- Items older than 30 days are cleared by the server.

One inbox item

Always there: `id, ruleType, subjectType, subjectId, billId, daysFromDue, firedOn, headline, outcome, createdAt, acknowledgedAt`.

Sometimes there: `supplierName, dueDate, subjectDisplay, amount, currency, discountPercent, discountExpiresOn, discountSaving, reason, occasion, occasionDate, recurringBillId, intakeId, arrivedBillId, variancePercent, read`.

How to write the line

1. **With `supplierName` and a due date** (before-due and late): count days from `dueDate` to today in Muscat time, not from `daysFromDue`.
   - Before: "{supplier} due in 3 days" (or "due tomorrow")
   - On the day: "{supplier} due today"
   - After: "{supplier} unpaid for 9 days"

2. **Discount** with percent, date and saving: "{supplier} 2% discount expires 28 Sept", "runs out today" or "expired {date}". Second line "Saves {amount}" until the date has passed.
3. **Other kinds** use `daysFromDue` (made positive): e.g. "Two approvals waiting 6 days", "mismatch unresolved". A scan uses the file name: "{name} unconfirmed for 2 days".
4. **No supplier and no name:** show the server's `headline` as it is.

Second line: "{amount} still to pay." for bills, "{amount} held up." for approvals, "Usually {amount}." for recurring bills, and "{percent}% above (or below) the usual amount." when a recurring bill arrived out of range.

Where a tap goes

Item	Open
A bill (`billId`)	the bill
A recurring bill (`recurringBillId`)	the recurring bill
A scan (`intakeId`)	the scanned upload
Out of range (`arrivedBillId`)	the bill that arrived

5. Not in the API yet, and a checklist

Do not build these on mobile yet

What	Why
Pause reminders for one invoice	No API. Only the whole-company switch exists.
Income queue ("Scheduled" list)	No endpoint. Show reminders per invoice instead.
Tone, message templates, "Stop sending when" rules, hold for 24 hours, approval for the final notice	Marked "Not in the API yet" on the web. Only paid and opted-out customers stop reminders today.
Send hour, sender, reply-to, attach PDF	Set for the whole installation; read-only.

What	Why
"Send me today's now" for bill reminders	No API yet.
Push notifications to the phone	No device or push API. Read the unread count when the app opens.

Also unknown: the server gives no special `error` code for an income schedule switched on with no rungs (only HTTP 400), so check it on the phone first.

Checklist before handing over

- [ ] Income settings: switch and days read and save; the list after saving is the server's list.
- [ ] Invoice card: preview sent with today's `days_from_due` (Muscat time); Send now shown only for SEND, NO_RUNG_TODAY and TENANT_DISABLED; a confirm step, since a rung is used up for good.
- [ ] Invoice history shows Sent, Failed and Skipped.
- [ ] Bill rules: six fields only per rule; full recipients always sent; recurring bills shown as "set per bill".
- [ ] Delivery settings always send `digestTime`.
- [ ] Bell: count on open, list on panel open, mark one and mark all; tap opens the right screen.
- [ ] Permissions hide what the user cannot do (table in section 0).
- [ ] English and Arabic for every line; rial sign with three decimals.

Screens were taken from the web app on `main` on 3 Oct 2026 against the test server, so names and amounts are sample data.
